Narcissus serotinus Loefl. ex L. (Amaryllidaceae), especie confirmada para la provincia de Cádiz (Andalucía, España)

Key words: Chorology, Amaryllidaceae, *Narcissus serotinus*, Cádiz.

Palabras clave: Corología, Amaryllidaceae, *Narcissus serotinus*, Cádiz.

Narcissus serotinus Loefl. ex L. and *N. obsoletus* (Haw.) Steud. have been actively mistaked. This fact can be stated in Valdés (1987); *N. serotinus* was catalogued as a very common species in most of western Andalusia whilst *N. obsoletus* was either dismissed or more feasibly included in the former. Something similar happened in eastern Andalusia, where only *N. obsoletus* inhabits, which has been commonly confused with *N. serotinus* (Navarro 2009). More recently, the distribution of both species has been clarified. *Narcissus serotinus* grows in southwestern Iberian Peninsula (Badajoz, Cáceres, Córdoba, Huelva and Seville in Spain; Alentejo and Algarve in Portugal), whereas *N. obsoletus* does it in southern and eastern Spain (Alicante, Almería, Barcelona, Cádiz, Castellón, Córdoba, Gerona, Huelva, Málaga, Murcia, Seville, Teruel, Valencia and Balearic Islands) according to Aedo (2013).

Considering records from www.anthos.es (last access August 2019), there is a herbarium sheet from 1956 which has been recently revised and identified by Aedo as *N. serotinus* in the province of Cádiz (CÁDIZ. Villamartín, [30STF68], XI-1956, s.c., (GDA 187)). Herbarium specimens from this province, and classified as *N. serotinus* or *N. obsoletus* from SEV, have been revised by the authors; all of them belonging to the latter (see Annex I). Therefore, the current work confirms the presence of *N. serotinus* in the province of Cádiz, whose last collection was in 1956. Information about the new finding is given below as follows:

CÁDIZ. Villamartín: Santa Lucía [30STF7084], 174 m, 13-XI-2018, J. López Tirado s.n. (COFC 66116).

The target locality has been found in the northern area close to Seville province. It is composed of hundreds of specimens in a high density. Most of them were fructifying when found; one flowering plant was collected (Fig. 1) and deposited in the *Herbarium of the Faculty of Sciences of Córdoba (COFC)*. This is probably the southernmost population in the Iberian Peninsula.
